

Terrarium General Maintenance

- Trim plants when crowding at the roof of enclosure (blocking light)
- Mist enclosure with dechlorinated water once or twice a day depending on whether misting system is installed and type of environment.
- Perform respective animal care.
- Top up leaf litter and botanicals (boil if harvested locally).
- If mold appears consistently, top up springtails.
- If drainage layer is submerged, drain using siphon.

Before Trim

After Trim

Paludarium General Maintenance

Standard:

Perform 50% water change once a month or when water section gets murky or dirty. Use dechlorinated water, or rainwater (DW/RW).

Trim plants when crowding at the roof of enclosure (blocking light)

Mist enclosure with DW/RW once or twice a day depending on whether misting system is installed and type of environment. Perform respective animal care.

Biotope/ecosystem:

Top up/drain water when water level fluctuates with DW/RW.

Trim overcrowded plants. Top up leaf litter and botanicals (boil if harvested locally).

Mist enclosure with DW/RW once or twice a day depending on whether misting system is installed and type of environment.

Aquarium General Maintenance

Standard: During first 2 months of development, perform 50% water change with dechlorinated tap water or rain water (DW/RW) once every two weeks, dose relevant GH and KH. Henceforth, top up water when evaporation occurs with DW/RW, perform 25% water change monthly. During all water changes, siphon detritus and mulm build up in and on top of substrate. For assurance on aquarium health, water tests can be performed once a month. Trim plants when necessary.

Biotope/ecosystem: Top up water when evaporation occurs with DW/RW. Remove decayed leaves and botanicals and top up with fresh material (boiled or sterilised before adding). Trim plants if necessary. Perform 25% water change once every 2 months, or more regularly when aquarium health is diminishing. Perform regular water tests to ensure stability.

Garden General Maintenance

Pond Maintenance:

Test water monthly to assess ecosystem health.

Change water 25% with rainwater or dechlorinated tap water (RW/DW).

Feed animal inhabitants as required.

For nutrient dosing, based on substrate allocated, specific instructions will be given based on plant type and habitat. For more information on this, please contact us!

Garden Maintenance:

Water garden with RW/DW daily, respective to type of environment and soil, as well as seasons, (drier seasons typically require more frequent watering), if sprinkler system is installed, automatic schedule will be set.

For nutrient dosing, pour El Primo liquid (if you have a Terra Rewilding compost bin), over newer plants and sparse areas weekly. For general areas, pour over biweekly (do not pour in pond).

For more information on Terra Rewilding compost bins, please contact us!
